## (Triangles and Parallel Lines)

Triangle :- Consider any three non-collinear points P, Q and R. Join them as PQ, QR and RP. The figure formed by joining three non-collinear points by line segments is called a triangle.

(i) three points P, Q and R which are called its vertices.

(ii) three line segments PQ, QR and RP which are called its sides.

(iii) three angles  $\angle QPR$  ( $\angle P$ ),  $\angle QRP$  ( $\angle R$ ) and  $\angle PQR$  ( $\angle Q$ ) which are called its interior angles or simply angles.

Note :- A Triangle is the polygon with the least number of sides.

## Interior and exterior of a Triangle

The part of the plane enclosed by  $\triangle PQR$  is called the interior of  $\triangle PQR$ .

In the  $\triangle PQR$ ,  $E$  and  $H$  are the interior points of  $\triangle PQR$ .

- (i) The part of the plane not enclosed by  $\triangle PQR$  is called exterior of  $\triangle PQR$ .
- (ii) The point  $K$  and  $G$  are the exterior points of  $\triangle PQR$ .
- (iii) The points  $F$  and  $J$  lie on  $\triangle PQR$ .
- (iv) The interior region along with the boundary is known as the triangular region.

## Exterior Angle of a Triangle

Let  $PQR$  be a triangle. Produce one of its sides. Say  $QR$  to  $S$ . Then  $\angle PRS$  is called an exterior angle at  $R$ .

Since,  $QS$  is a straight line,

$$\angle QRP + \angle PRS = 180^\circ$$

The angles  $\angle PQR$  and  $\angle QPR$  are called interior opposite angles of the extension  $\angle PRS$ .

Hint

Exercise 11.1 - Question No 1, 2, 3, 4 and 5 complete.
